

ABSTRACT

The development of technology and science in the current era has a big effect on life, including in the field of education. Many schools from high school, junior high school, elementary school, even kindergarten or early childhood education have developed themselves to provide quality learning or educational services by implementing computer-based information systems. Recording the value of report cards that are done manually or written in a report book is the old method used. So it is necessary to have a system that helps to facilitate the assessment of report cards. The method used in this study is a qualitative method. The method which emphasizes a deeper understanding and uses a deductive - inductive approach. Then the development method for the information system that will be proposed is the waterfall method. Generate an integrated report card score information system to make it easier for PAUD schools in the Banjar City area to process data. If a student or student loses their report card, the data is already recorded in the information system. Makes it easier to manage report card grade data without the need to collect and write report cards because they are already stored in the database. Make it easy for students or student guardians to check their child's report card grades.
