*The development of the agricultural sector is an important role that has a significant contribution to the development of the national and regional economy. One of the agricultural food sectors which is the main and strategic staple food in the world is rice. This research aims to determine the influence of rice production, rice prices, exchange rates and inflation partially and jointly on rice imports in Indonesia from 2005 to 2022. The data analysis technique used in this research is multiple linear regression analysis, classical assumption test, hypothesis testing, and coefficient of determination ( $R^2$ ) testing. The results of this research show that rice production and the exchange rate have a significant negative effect, rice prices have a significant positive effect, and inflation has a partially positive and insignificant effect on rice imports in Indonesia in 2005-2022. Then the results of research on rice production, rice prices, exchange rates and inflation together have a significant influence on rice imports in Indonesia in 2005-2022.*

***Keywords:*** *rice imports, rice production, rice prices, exchange rate, inflation.*
