**THE RELATIONSHIP BETWEEN THE PHYSICAL ENVIRONMENT OF  
THE HOUSE AND THE INCIDENCE OF ISPA IN TODDLERS IN THE  
WORK AREA OF THE MANGKUBUMI HEALTH CENTER,  
TASIKMALAYA CITY**

This study aims to evaluate the relationship between the physical environment of the house and the incidence of Acute Respiratory Tract Infection (ISPA) in toddlers in the Mangkubumi Health Center Working Area, Tasikmalaya City. The variables studied included ventilation area, floor type, wall type, and room occupancy density. Primary data were collected in April 2024 from 46 toddlers, with 23 toddlers each in the ARI case and control groups. The results showed that there was a significant relationship between the factors of physical condition of the house and the incidence of Acute Respiratory Tract Infection (ISPA) in toddlers in the Mangkubumi Health Center Working Area. There is a significant relationship between ventilation area, type of floor, type of wall and room occupancy density. Suggestions from researchers are for health workers to provide counseling and motivation about the importance of knowing the causes and risks of ISPA in children.
