This study aims to analyze the characteristics of monetary poverty and examine the effects of the age of the household head, sex of the household head, number of household members, and education level of the household head on monetary poverty in Tasikmalaya Regency. The study employed a quantitative approach using descriptive analysis and logistic regression on the March 2024 Susenas data covering 999 households. The results showed that most households were classified as non-poor; while 65 households, or about 6.5 percent, were categorized as poor. Partially, the age of the household head and the number of household members had a positive and significant effect on monetary poverty, while the education level of the household head had a negative and significant effect. The sex of the household head did not have a significant partial effect. Simultaneously, all independent variables had a significant effect on monetary poverty. These findings indicate that improving education and controlling household dependency burden are important aspects of poverty alleviation efforts in Tasikmalaya Regency.

Keywords: *monetary poverty, Susenas, logistic regression, household, Tasikmalaya Regency.*
